INTRODUCTION AND ACKNOWLEDGMENT

This report presents detailed results of the 1985 Comprehensive Salary and Employment Status Survey. A summary of the 1985 findings was published in the July 8, 1985 issue of Chemical and Engineering News.

General oversight of the survey and its analysis was provided by the ACS joint Board-Council Committee on Economic Status, headed by Attila E. Pavlath¹, and by its subcommittee on surveys, chaired by Jack G. Kay². The committee expresses its gratitude to the more than 44,000 ACS members who provided an invaluable service to the profession by completing the survey questionnaire.

This year far more than the usual number of ACS members participated in the annual survey. The large number of respondents allows a much more detailed investigation of subgroups that in other years have had few representatives in the survey sample. The analysis will appear in forthcoming ACS publications and will be the basis of a symposium at the spring 1986 ACS national meeting. The symposium is a project of the ACS Task Force on Women Chemists, headed by Nina M. Roscher³.

Terrence Russell and Nguyen Bailey of ACS Statistical Services prepared this report, and Dr. Russell wrote the summary and comment on the following pages.

SUMMARY AND COMMENT
Dr. Terrence Russell*

Employment and Unemployment

Among ACS member chemists the overall unemployment rate as of March 1 decreased for the second consecutive year. In 1985 the rate declined to 1.4%, after having been 1.7% in 1984 and 2.2% in 1983. The percent of chemists employed full-time rose 1.5 percentage points to 95.2% as the percent of part-time workers decreased. Each tenth of a percentage point represents approximately 90 ACS members in the U.S. work force.

Women. The unemployment rate for women chemists was 2.1%; for men, 1.3%. This difference can be partially accounted for by the relative youth of the women in the Society and by their relative lack of advanced degrees. Although 55% of the women are less than 35, only 27% of the men are so young, and whereas 70% of the men hold advanced degrees, only 54% of the women do.

Minorities. Among minority chemists, a much smaller fraction than last year held postdoctoral positions: 4.8% compared with 8.3% a year ago.

Non-Academic Chemists. Unemployment rates were not uniform for all members. Generally speaking, unemployment rates in the non-academic cohort were higher for women, minority group members, chemical engineers, those who had the B.S. as the highest degree, and for those less than 30 years old.

As the level of general unemployment fell, the percent of unemployed chemists experiencing long periods of unemployment decreased. In 1984, 44.1% of those who were unemployed on March 1 had been unemployed for 8 months or more, whereas in 1985 only 40.5% had been unemployed even for as long as 7 months.

Academic Chemists. Among academics, full-time employment was 90.7% for men, 77.6% for women and 88.4% overall. A larger percent of both men and women held postdoctoral fellowships in 1985 than in 1984. The percent who held postdoctoral positions was somewhat larger among women than among men: 7.9% vs 6.3%). The most striking feature of the academic employment picture is the large percent of part-time workers among women PhDs: of the women who work in two-year, four-year and MS-granting departments approximately 16% are employed part-time: roughly 10 times the rate for men. Accordingly, women constitute only 16% of the academic chemistry work force but 52% of the part-timers.

Recruiting

Reflecting the unsettled economic picture in the chemical industry, the recruitment of recent graduates declined during 1984-85. The College Placement Council's CPC Salary Survey issued July, 1985 showed an 8% increase in the number of offers made to chemical engineering graduates during the 1984-85 academic year as compared with 1983-84 (2263 vs 2096). Offers to B.S. chemists decreased by 12% (169 vs 193). Among new PhDs, an increase of 28% was reported for chemical engineers (209 offers vs 163 offers). Offers to PhD chemists declined in number by 24% (215 vs 282).

Salaries

Median salaries reported in the survey showed modest gains. The overall median salary for PhD chemists increased approximately 5% (to \$44,000) while master's degree chemists reported an increase of 6% to \$36,000 and the bachelor's degree chemists median salary increased 4% to \$32,000. Although the March-to-March increase in the consumer price index (4%) was less than in recent years only the salary increases for PhDs and masters represented increases in constant dollars. Because salaries are not much different from one region to another or from one employment sector to another, the increases do not show interesting geographic or sectoral differences.

PhDs in industrial jobs fared better than their academic colleagues even after academic year salaries were adjusted to a 12 month base: the median salary of all industrial PhDs was \$51,800; the salary of academic PhDs adjusted to a 12 month base: \$39,600. Salaries differ widely among academic chemists according to seniority, academic rank and academic assignment: teaching, research, or administration.

Briefly, we note that salary differences between men and women shown in past editions of this survey report persist. In industry, the age-adjusted average salary for women PhDs was 89% of that for men, in government 86%, and in academia 80%. Most of the difference represents differentials between the salaries in management and administration (where there are few women) and the salaries in research and teaching (where nearly all the women are).

Detailed analyses of the salaries and working conditions of women chemists will appear later this year and in 1986. In addition to the tables presented in this book, ACS will publish other reports of the results of the survey, dealing with items on the questionnaire that are not covered here, such as attitudes toward one's job, the structure of responsibility in the job, the effect of two-career marriages, and the career characteristics of immigrants.

TECHNICAL NOTES

The target population of the 1985 Comprehensive Salary and Employment Status Survey was those ACS members who had U.S. mailing addresses, were not older than 70, and had neither student nor emeritus status. On January 31, 1985 the ACS membership totalled 134,019, of which 86,609 were eligible for inclusion in the survey.

The survey questionnaires were mailed to this group of members by bulk mail during the week of February 18-22. By the May 15 cut-off date, 43,754 (50.5%) usable questionnaires had been returned.

The survey data were processed on the Alpha-Micro computer at the ACS Statistical Services. Computer programs for the processing were written by Harry Foxwell, Bob Jones, and Sandy Schowgurow.

Definitions

For the purposes of the survey analysis only, the following definitions were used:

Chemist: a respondent who indicated a work specialty of chemistry or biochemistry (categories 2 through 14 of question 1b on the questionnaire).

Chemical Engineer: a respondent who indicated a work specialty of chemical engineering (category 1 of question 1b on the questionnaire).

Unemployed: a respondent who is unemployed and seeking employment (category 4 of question 1d on the questionnaire).

Academic Salaries: For those respondents indicating academic year contracts, base salary figures were multiplied by 11/9 to provide a direct comparison with respondents on calendar year contracts.

This report represents the respondents' principal annual salaries as of March 1, 1985. The respondent's age is given as of March 1, 1985. A respondent's state and geographic region refer to place of residence rather than place of employment.

Proportions

The proportion of people falling within a certain cell in one of the tables is a sample proportion. The sample proportion is used to make statements about the corresponding population proportion, but, of course, the sample proportion generally is not exactly equal to the population proportion. A useful estimate of the representiveness of the sample proportion is the confidence interval. Such an interval estimate is illustrated in the following statement. "We assert with 95% confidence

that the population proportion is between 0.4 and 0.06." A simple but adequate formula for a confidence interval centered on the sample proportion is

$$\begin{aligned}
 p(\text{lower}) &= \hat{p} - z[\hat{p}(1-\hat{p})/n] \\
 \text{and } p(\text{upper}) &= \hat{p} + z[\hat{p}(1-\hat{p})/n]
 \end{aligned}$$

where

- $p(\text{lower})$ = lower boundary of the interval
- $p(\text{upper})$ = upper boundary of the interval
- \hat{p} = the sample proportion
- z = a function of the level of confidence and is found in a table of the standard normal distribution.
- n = the sample size

Inspection of the formula shows that the width of the confidence interval is inversely proportional to the square root of the sample size, so that proportions derived from small samples are not as precise as ones drawn from large samples. Also, if non-respondents differ from respondents with regard to the characteristics under consideration, the formula will overstate precision because the formula is based on assumption of 100% response.

Suppose a confidence interval is required for a group containing 1900 sample members. If the sample contains 95 persons with a specific characteristics, then the numbers that go into the formula are $p=95/1900=0.05$ and $n=1900$. For a 95% confidence interval, z is about 2. Putting these numbers into the formula above we have

$$\begin{aligned}
 p(\text{lower}) &= \hat{p} - z[\hat{p}(1-\hat{p})/n] \\
 &= 0.05 - 2[0.05(0.95)/1900] \\
 &= 0.05 - 0.01 \\
 &= 0.04
 \end{aligned}$$

and similarly, $p(\text{upper}) = 0.05 + 0.01 = 0.06$

Thus, a 95% confidence interval for p is from 4.0% to 6.0%. Although we cannot say that the population proportion is exactly 5.0%, we can be confident that it is between 4.0% and 6.0%. The 95% level of confidence means roughly that if this procedure were followed a large number of times using different samples of the same size, the population proportion would be within the calculated interval about 95% of the time.

Small Cell Count

If the number of responses in a cell of a salary table is small, then the sample salary statistics for that cell may not accurately estimate the corresponding population salary statistics. In general, a cell containing fewer than 15 responses does not provide a useful estimate of the median salary, and a cell containing fewer than 25 responses does not provide a useful estimate of the 25th or the 75th salary percentile.

Percentiles

If a sample of size n is arranged in ascending order of magnitude, the j th percentile P_j , $j=1,2,\dots$ or 99 is given by the $(j(n+1)/100)$ th value. If $(j(n+1)/100)$ is not an integer, then the j th percentile is a weighted average of the two values whose ranks are closest to $(j(n+1)/100)$.

Discrepancies Among Tables

Some pairs of tables contain totals that should be identical but are not. For example, two tables that present information about PhD respondents should show the same total number of PhDs. They might, however, show different totals. To illustrate, if one table groups the PhDs according to specialty and the other groups them according to geographic region, the totals will differ unless the number who did not indicate their specialty is the same as the number who did not indicate their geographic region.

Comparing Salaries

Often questions arise concerning B.S. chemists' salaries as compared with M.S. chemists', or chemists' salaries as compared with chemical engineers'. These and similar comparisons require caution.

Statistical tests should be performed to determine whether observed differences in salaries of various sample groups could be mere chance occurrences resulting from peculiarities of the sample. Whether a difference in salaries is "statistically significant" depends not only on the magnitude of the difference but also on the sample size and the magnitudes of the sample standard deviations.

References for statistical tests of significance can be found in Numerical and Statistical Techniques, by J. H. Pollard, Handbook of Tables for Probability and Statistics, published by the Chemical Rubber Company, and other similar texts.

American Chemical Society

OFFICE OF THE
EXECUTIVE DIRECTOR

1155 SIXTEENTH STREET, N.W.
WASHINGTON, D.C. 20036
Phone (202) 872-4600

February 22, 1985

Dear Member:

The American Chemical Society makes an annual report on the economic status of the chemical profession, usually as reflected in a sample survey of its membership. This year, we are asking every ACS member in the U.S. who is under 70 years of age and neither retired nor a student to participate. The survey is sponsored by the Council Committee on Economic Status.

The questionnaire before you touches on three topics: salary, the demographic composition of the membership, and members' jobs: how they are structured and how members rate them. These questions asked of such a large group will allow us to report to you on many more groups within the ACS than was previously possible. Information will now be available for more chemistry specialties, more industrial sectors, smaller geographic areas and other groups such as women chemists, chemists employed in government, chemists with the master's as the highest degree, chemists employed part-time, and handicapped chemists.

Your participation will be an important service to your colleagues, because a high response rate is needed to assure accurate results. Please take a few minutes now, while the survey form is before you, to fill out the questionnaire and return it in the enclosed postage-paid envelope. The procedure is confidential, and the information you provide will be combined with returns from other members so that only aggregated data will be available.

Findings will be reported to ACS members in several ways in 1985. Preliminary results will be presented at the spring meeting in Miami Beach and a summary of the findings will appear in CHEMICAL AND ENGINEERING NEWS late this spring. Detailed analyses will be published by the ACS as Salaries 1985 and Women Chemists 1985.

Thank you for your assistance.

Sincerely,

A handwritten signature in cursive script that reads "John K. Crum". The signature is written in black ink and is positioned above the typed name and title.

ACS OFFICE OF STATISTICAL SERVICES PUBLICATIONS

Salaries: The Office of Statistical Services annually surveys the ACS membership, gathering detailed information on member chemists and chemical engineers. The reports based on this survey contain statistical tables describing the respondents' employment status, employers, work function and specialty, salaries, and geographic and other demographic characteristics.

Reports are available for each year from 1973 through the current year.

Starting Salaries: The Office of Statistical Services also surveys new graduates in chemistry and chemical engineering each summer, and publishes reports detailing the graduates' employment status, post-graduation plans, starting salaries, and other employment and demographic characteristics.

Reports are available for each year from 1975 through the current year.

Professionals in Chemistry: The Professionals in Chemistry series compiles information concerning chemists and chemical engineers from ACS, government, and private industry sources. It details information on demography, employment, salaries, education, and supply and demand for the entire chemical profession.

Reports are available for each year from 1975 through 1978, and combined reports for 1979-80, 1981-82, and 1983-84.

Special Reports:
