Grade 5 - Lesson 3.5
Activity Sheet
Reactions with Different Changes

Name: __________________
Date: ___________________

ACTIVITY

Question to investigate:
What are the similarities and differences in the reactions between citric acid + baking soda and calcium chloride + baking soda?

Materials
- Citric acid
- Baking soda
- Calcium chloride
- Universal indicator
- Water
- Graduated cylinder or plastic tablespoon
- Thermometers
- Plastic measuring spoon, ½-teaspoon size
- 2 Clear plastic cups
- 2 Small cups

Baking soda and citric acid
Procedure
1. Use a graduated cylinder or a plastic tablespoon to measure 15 mL (1 tablespoon) of the universal indicator solution and pour it into one of the clear plastic cups.

2. Place a thermometer in the indicator solution and record the initial temperature on the activity sheet.

3. In a separate small cup, combine 1/2 teaspoon of citric acid and 1/2 teaspoon of baking soda.

4. While the thermometer is still in the indicator solution, pour the citric acid and baking soda mixture into the indicator solution. Observe and record any color changes and/or temperature changes that occur.

WHAT DID YOU OBSERVE?
1. What changes did you observe when you mixed baking soda with citric acid in the universal indicator solution?

Safety: Wear safety goggles and be sure to follow all safety instructions given by your teacher. Wash your hands after completing the activity.
**Baking soda and calcium chloride**

**Procedure**

1. Use a graduated cylinder or a plastic tablespoon to measure 15 mL (1 tablespoon) of the universal indicator solution and pour it into the second clear plastic cup.

2. Place a thermometer in the indicator solution and record the initial temperature on the activity sheet.

3. In a separate small cup, combine 1/2 teaspoon of calcium chloride and 1/2 teaspoon of baking soda.

4. While the thermometer is still in the indicator solution, pour the calcium chloride and baking soda mixture into the second indicator solution. Observe and record any color changes and/or temperature changes that occur.

**WHAT DID YOU OBSERVE?**

2. What changes did you observe when you mixed baking soda with calcium chloride in the universal indicator solution?

**EXPLAIN IT WITH ATOMS & MOLECULES**

3. You mixed citric acid with baking soda, and in a separate test you mixed calcium chloride with baking soda. Why do you think the reactions you observed were different?

**TAKE IT FURTHER**

You saw a demonstration in which an Alka-Seltzer tablet was placed in a universal indicator solution.

4. What changes did you observe?

5. Was this reaction similar to what you expected? Why or why not?
